Vermont Blueprint for Health

# St. Albans Area Community Network Report

Network Analysis and Team Based Care

Maurine Gilbert, contracted Community Facilitator July 2015

## Objective

Describe the network of organizations that has emerged in each Blueprint Health Service Area (HSA) to support population and individual health, focusing on modes of collaboration and relationships between organizations.

#### Background and Key Questions

The Vermont Blueprint for Health is a state-led, nationally-recognized initiative transforming the way primary care and comprehensive health services and delivered and paid for. The Blueprint encourages the growth of regionally-based multi-disciplinary networks of health, social and economic service providers. These networks are intended to bring a diverse group of service providers closer together, to deliver more seamless and holistic care to the people of their regions. This study is the first step towards answering key questions about the networks that are active in Blueprint communities: *What role did investment in core Community Health Teams have in seeding these larger networks? How are the participating organizations connected to each other? How are these relationships maintained and reinforced – how durable are they? What characteristics do the most successful networks share? And, ultimately, what impact do that have on individual and population health?* 

## Approach

This study used a combination of network analysis, investigating connections between organizations, and traditional polling methodology, addressing the experience of working together as a team.

#### Network Analysis

Network analysis was the central methodology in this study, used for its ability to characterize and quantify relationships in a complex system. Network analysis creates graphs that show the connections between individuals or (as in this case) organizations. With these graphs and quantitative network data, researchers and community members can explore the relationships that make up the network and start to look for patterns as well as changes over time. Observations of network data and network graphs can lead to smarter, better questions about how community-based teams coalesce and how they create change.

The data used in this study are responses to a survey question that asked representatives of organizations to report whether their organization interacted with other organizations in their area in any (or all) of six ways, stated as follows:

- 1. "My organization sends referrals to this organization"
- 2. "My organization receives referrals from this organization"
- 3. "Our organizations have clients/patients in common"
- 4. "Our organizations share information about specific clients/patients"
- 5. "Our organizations share information about programs, services and/or policy"
- 6. "Our organizations share resources (e.g. joint funding, shared equipment, personnel or facilities)"

Additionally, several questions were included in the study that were not intended for network analysis. These included demographic questions and a set of questions about whether respondents perceived their communities to be acting as teams.

#### Team Based Care

In 2012 The Institute of Medicine (IOM) published the discussion paper <u>"Core Principles & Values of</u> <u>Effective Team-Based Health Care."</u> The Vermont Blueprint for Health embraces this paper's model, of how a team should function and feel, as a goal for both direct clinical care and multidisciplinary community health improvement. The five hallmarks of effective team based care given by the IOM are Shared Goals, Mutual Trust, Clear Roles, Effective Communication, and Measureable Processes and Outcomes. In the FY2015 survey, respondents were asked to think about how all of the organizations listed work together as group, and agree or disagree with statements about whether they exhibit each of those hallmarks of team-based care.

## Network Analysis

Network analysis was the central methodology in this study, used for its ability to characterize and quantify relationships in a complex system. Network analysis creates graphs that show the connections between individuals or (as in this case) organizations. With these graphs and quantitative network data, researchers and community members can explore the relationships that make up the network and start to look for patterns as well as changes over time. Observations of network data and network graphs can lead to smarter, better questions about how community-based teams coalesce and how they create change.

The data used in this study are responses to a survey question that asked representatives of organizations to report whether their organization interacted with other organizations in their area in any (or all) of six ways, stated as follows:

- 7. "My organization sends referrals to this organization"
- 8. "My organization receives referrals from this organization"
- 9. "Our organizations have clients/patients in common"
- 10. "Our organizations share information about specific clients/patients"
- 11. "Our organizations share information about programs, services and/or policy"
- 12. "Our organizations share resources (e.g. joint funding, shared equipment, personnel or facilities)"

Additionally, several questions were included in the study that were not intended for network analysis. These included demographic questions and a set of questions about whether respondents perceived their communities to be acting as teams.

## List Development

Over the course of the 2015 network survey, the list development methodology used for this study was adjusted twice in response to findings from the research, which was conducted in waves. Each adjustment pushed the network bounding towards greater consistency across HSAs and towards smaller network membership lists and shorter survey instruments.

This HSA was in the second wave of communities surveyed, using the Community Network List Development approach.

With this methodology, the network list began with a core group of organizations similar to the organizations represented in the area's Unified Community Collaborative, as shown below.

Types of Organizations Included in Seed List for Community
Network List Development
Community Health Team
Each Blueprint PCMH primary care practice
Known non-Blueprint primary care practices
FQHC dental clinic
Hospital
Hospital – Emergency Department
Hospital – Case Management/Social Work Department
Designated Mental Health Agency
"Hub" of Hub/Spoke Program
VNA
Area Agency on Aging
Designated Regional Housing Organization – SASH Program
State of VT – Agency of Human Services (AHS)
State of VT – Vermont Chronic Care Initiative (VCCI)
State of VT – Vermont Department of Health (VDH)

Contacts at each of the corresponding organizations in an HSA were emailed a request to review the list of organizations and add to it any organization not already included, that their organization works with on an ongoing basis to provide medical, health and wellness, or health support services. Sample email text is given below. Non-respondents were emailed a reminder request.

Sample email text inviting participation in Community Network List Development:

Hello,

The Vermont Blueprint for Health is requesting your help. We are launching the 2nd year of a study of Vermont's community health networks, including the network that is active in your area. We want to know who the players are, how they work together, and what impact they are having on individual and population health. Our first step is to create a community-generated list of network members. We have a partial list of organizations (below) and would like your help completing it.

Please review the list below and add to it any organization that your organization works with on an ongoing basis to provide medical, health and wellness, or health support services. Please add as many additional organizations as fit this description and serve the \_\_\_\_\_\_ Health Service Area (which encompasses \_\_\_\_\_ County). Departments of the State of VT or other large organizations may be entered on separate lines.

SEED LIST:

1. 2. 3.

4.

Responses were compiled, sorted and tallied. Organizations receiving at least two mentions were included in the final survey list in cases where the resulting list would be less than or equal to forty organizations, organizations receiving at least three mentions were included in the final survey list in cases where the resulting list would be more than forty organizations. This approach limited the number of organizations in the survey, so that the survey would be a manageable length. Representatives of all organizations included in the final list – core members and community additions – were invited to take the survey themselves.

# Survey Participation

Invitations Sent	40
Surveys Started	37
Response Rate	93%

Green Mountain Transit Agency	
NMC - Comprehensive Pain Management	
The Howard Center - St. Albans-based programs and services	Y

## Data Analysis

Non-network data analysis was conducted in Survey Monkey and Excel.

Network analysis was conducted using Gephi. Data is input into Gephi in node lists and edge lists. Node lists are lists of the names/labels of the organizations included in the study and a corresponding number. Edge lists are lists of the connections between organizations. In this study each edge list represented all the instances of a single type of connection (sharing resources, for instance) in a single HSA. The edge lists began with an extract of data from Survey Monkey, a grid format recording each connection between organizations. The grids were transformed in a series of steps into the edge lists, which code connections in pairs of numbers giving the "Source" and "Target" of each connection. The edge lists used in this study have been de-duplicated – in cases where multiple respondents answered on behalf of a single organization the connection between that organization and any other organization will appear only once per list. This choice was made to prevent over representing the role in the network of organizations fielding multiple respondents.

### Results

#### Network Analysis Glossary

The following are brief definitions of network terminology that will be used throughout the Results section.

#### Node

The "nodes" on these graphs are the dots that represent organizations

#### Edge

The "edges" on these graphs are the lines representing connections between organizations (connections of any sort, whether they represent sharing information, resources, or referrals)

#### Centrality

Importance or prominence of an actor in a network

#### Betweenness Centrality

A measure of how often a given node appears on the shortest paths between pairs of nodes in the network. Betweeness Centrality takes the entire network into consideration when calculating a score for an individual node, and is therefore considered one of the most powerful centrality measures.

#### Average Degree

The average number of edges connected to each node in the network

#### Average Shortest Path Length

The average number of edges on the shortest path between each pair of nodes in the network

#### Graph Density

The proportion of all possible connections (represented as edges) that are present

#### Modularity

A measure of how readily a network decomposes into modular communities or sub-networks. The modularity numbers given here are based on the modularity function used in the Gephi software program (there are many other "modularity" or "community detection" functions that may be used in network analysis.

#### Network Maps

#### See Appendix A for the Network Maps

#### **Network Statistics**

	Common Patients	Info – Patients	Info – Programs	Resources	Referrals	Full Network
Avg. Degree	13.486	12.081	10.324	3	17.514	21.027

### Organization Statistics

Organizations	Ranked by Betw	eeness Centrality

- 1 Northwestern Counseling and Support Services
- 2 State of VT Vermont Chronic Care Initiative (VCCI)
- 3 State of VT Vermont Department of Health (VDH)
- 4 State of VT Agency of Human Services (AHS)
- 5 Franklin County Home Health Agency

Organizations with Highest In-Degree	
Northwestern Counseling and Support Services	37
State of VT – Vermont Chronic Care Initiative (VCCI)	36
State of VT – Vermont Department of Health (VDH)	33
Franklin County Home Health Agency	33
Champlain Valley Area on Aging	30

## Team-Based Care

% of Respondents who "Agree" or "Strongly Agree" That Their Community Exhibits the Given Team Characteristics

## Observations and Opportunities

The following are the researcher's observations of the network graphs and team based care results, and related questions. Additional observations, questions, and ideas for improving network relationships and effectiveness will be solicited when these findings are presented in the community.

- More respondents (13%) agree that "when our organizations work together, each one has a clear role to play" than in the previous survey. What accounts for the increased clarity.
- More respondents (16%) agree that "our organizations measure the work we do together and its outcomes" than in the previous survey. Few other HSAs improved in this area are there measurement practices the St. Albans community can share?
- St. Albans is one of the few HSAs where the most central organizations do not include the hospital, primary care, or the Community Health Team. Here, the most central organizations are the designated mental health agency, State of VT services and the area's VNA.
